AMENDMENTS TO THE CLAIMS

Please add or amend the claims to read as follows, and cancel without prejudice or disclaimer to resubmission in a divisional or continuation application claims indicated as cancelled:

1. (Currently Amended)   A method of recording conversation comprising:

recording data ~~packet~~ packets of a conversation between a first wireless communication device to a second wireless communication device by alternating between a first active link of a wireless communication system which includes data packets of the first wireless communication device and a second active link of [[a]] said wireless communication system which includes data packets of the second wireless communication device;

receiving a command from a subscriber of a wireless conversation recording service to send ~~sending~~ the recorded data packets of the recorded conversation to [[a]] said subscriber; and

sending the recorded data packets of the recorded conversation to said subscriber.

2. (Previously Presented)   The method of claim 1, comprising:

storing the recorded data packets of the recorded conversation in a storage medium.

3. (Currently Amended)   The method of claim 1, comprising:

decoding a recorded media content of the recorded data packet by alternating decoding said packets with first and second media decoders; ~~and~~

generating a file that includes decoded media content of the data packets corresponding to the recorded conversation; and

storing the file at a secured location having a controlled access.

4. (Previously Presented)   The method of claim 3, comprising:

receiving a command for sending the file via a global network to a computer.

5. (Previously Presented)   The method of claim 1, comprising:

    receiving a command for sending the recorded conversation to a remote station via the wireless communication system;

    decoding the recorded data packets by alternating between a first media decoder and a second media decoder; and

    combining the decoded packets to generate a file that include the recorded media content of the conversation.

6. (Currently Amended)   A wireless communication system comprising:

    first and second wireless communication devices coupled by first and second wireless links to an at least one base station;

    a server to record a conversation between the first and second wireless communication devices according to a received command from a subscriber of a wireless conversation recording service, operably coupled by a first link and a second link to the at least one base station, wherein the server includes comprising first and second media recorders to record a conversion by alternately recording data packets of media content of the conversation received from [[a]] the first active link and [[a]] the second active link of the wireless communication system, respectively[[,]]; and

    a controller to alternate between the first link and the second link, and a storage medium to store [[the]] recorded data packets of the conversation; and

    a remote station to send a command to receive the recorded packets of the conversation.

7. (Previously Presented)   The system of claim 6, wherein the server comprises:

    a file generator to generate a file which includes a recorded media content of the first link and the second link by alternating between a first media decoder to a second media decoder and combining the decoded media content from the first and second media decoders to the file; and

    a secured storage location having a controlled access to store the file.

8. (Original)   The system of claim 7, wherein the secured storage location is a media
    mailbox.

9. (Previously Presented)   The system of claim 7, comprising:

    a gateway to connect the wireless communication system to a global network;
        and

    a computer operably coupled to the global network to play the file via the global
        network by alternately decoding with the first media decoder and the second
        media decoder.

10. (Original) The system of claim 6, wherein the remote station is a personal
    communication assistant (PCA).

11. (Currently Amended).   ~~An apparatus~~ A server of recoding a conversation between first
    and second wireless communication devices comprising:

    first and second media recorders to record the conversation by alternately
        recording data packets of media content of the conversation received from a
        first active link of a wireless communication system operably coupled to the
        first wireless communication device and [[a]] the second active link of a
        wireless communication system operably coupled to the second wireless
        communication device respectively;

    a controller to alternate between the first active link and the second active link;

    a storage medium to store the data packets; and

    first and second media decoders to decode the recorded media content of the
        conversation.

12. (Currently Amended)   The ~~apparatus~~ server of claim 11, comprising:

    a file generator to generate a file by combining the decoded media content from
        the recorded data packets; and

    a secured storage location having a controlled access to store the file.

13. (Currently Amended)   The ~~apparatus~~ <u>server</u> of claim 12, wherein the secured storage location is a media mailbox.

14. (Currently Amended)   A method <u>of providing a wireless conversation recording service over a wireless communication system,</u> comprising:

> sending <u>by a subscriber of the wireless conversation recording service</u> a command ~~by a remote station~~ to record at a server of a wireless communication system a conversation of ~~the remote station~~ <u>a first wireless communication device</u> with ~~other remote stations~~ <u>a second wireless communication device</u> by alternately recording data packets of media content of the conversation received from a first active link <u>operably coupled to the first wireless communication device</u> and a second active link <u>operably coupled to the second wireless communication device</u> ~~of a wireless communication system,~~ using a first media recorder and a second media recorder, respectively; and
>
> storing recorded data ~~packet~~ <u>packets</u> of the recorded conversation at a storage medium of the server.

15. (Currently Amended)   The method of claim 14, comprising:

> sending a command by the ~~remote station~~ <u>subscriber</u> to the server to play a recorded media content of the conversation at [[the]] <u>a</u> remote station;
>
> decoding at the server the recorded media content by alternating between the first media decoder and a second media decoder; and
>
> transmitting by a base station a modulated decoded media content of the conversation to <u>the subscriber</u> ~~a commanding remote station.~~

16. (Currently Amended)   The method of claim 15, further comprising:

> providing to [[a]] <u>the</u> subscriber of [[a]] <u>the conversation</u> recording service a media mailbox to store the recorded media content of the conversation; and
>
> retrieving by the ~~remote station~~ <u>subscriber</u> a recorded conversation by accessing

the media mailbox.

17. (Currently Amended)   An article comprising a storage medium having stored thereon
instructions, that, when executed by a computing platform, result in:
   recording data ~~packet~~ <u>packets</u> of a conversation <u>between a first wireless</u>
      <u>communication device to a second wireless communication device</u> by
      alternating between a first active link <u>of a wireless communication system</u>
      <u>which includes data packets of the first wireless communication device</u> and a
      second active link of [[a]] <u>said</u> wireless communication system <u>which</u>
      <u>includes data packets of the second wireless communication device</u>;
   <u>receiving a command from a subscriber of a wireless conversation recording</u>
      <u>service to send</u> ~~sending~~ the recorded data packets of the recorded
      conversation to [[a]] <u>said</u> subscriber<u>; and</u>
   <u>sending the recorded data packets of the recorded conversation to said</u>
      <u>subscriber</u>.

18. (Currently Amended)   The article of claim 17, wherein the instructions result in:
   decoding a recorded media content by alternating between a first media decoder
      and to a second media decoder; and
   sending the decoded media content of the recorded conversation to [[a]] <u>the</u>
      subscriber that is an originator of the conversation recording.

19. (Previously Presented)   The article of claim 18, wherein the instructions result in:
   generating a file which includes the decoded media content of the conversation;
      and
   storing the file at a secured location having a controlled access.

20. (Previously Presented)   The article of claim 19, wherein the instructions result in:

      receiving a command for sending the file via a global network to a computer;
and

      storing the data packets of the recorded conversation at a storage medium.
